

Abstract

The invention relates to a thermotherapy device (1), in particular for babies comprising a lying surface (5) limited by longitudinal sides (2), a head side (3) and a foot side (4). The aim of said invention is to deliver the thermotherapy device (1) ensuring a simple and safe access of a newborn without producing a detrimental physical effect on parents. For this purpose, said invention is characterized in that a upwardly oriented feeding device (6) advantageously embodied in three parts for supplying a hot and humid air comprises a lateral feed pipe (7) in each longitudinal part (2) and/or a feed pipe (8) in each foot side (4), a suction device (9) for sucking a supplied air is arranged above the lying surface (5), the suction device (9) is arranged above the head side (3), in particular above the head area (3a) of the lying surface (5) limiting the head side (3) in such a way that the supplied air is sucked only above said head side and/or the head area (3a).
